

Gold Pipeline Output Analysis - Brief Report

No graphs included.

1. Executive summary

The new run did not complete the Gold pipeline. The failure occurred before Premium artifacts were produced. The uploaded submission is valid as a batch-style input, because it contains one essay inside the top-level essays list. However, the Premium runner still received the original batch JSON rather than a normalized single-essay JSON. Premium v14 expects essay_text at the top level, so it stopped with an input-schema error.

2. Evidence from uploaded output

Item	Observed evidence	Interpretation
Submission shape	Top-level key: essays; first essay contains essay_id, student_id, prompt_text, essay_text, task_type.	Batch input is present and usable after selecting essays[0].
Premium stdout	[ERROR] Input JSON must contain essay_text field.	Premium runner rejected the file because it did not see top-level essay_text.
Gold pipeline stage reached	Premium execution stage	Detector, scorer, evaluator, Gold feedback, LRET, Writing Coach, LIE, and routing were not reached.

3. Root cause

The v1.1 Gold runner fixed loading of batch submissions for its own internal submission object, but the Premium call path still passes the original --input path into pipeline_runner_v14j_revision_safe.py. That original path points to a JSON object shaped as {"essays": [...]}. Premium v14j is input-driven but expects one submission object shaped as {"essay_text": ..., "prompt_text": ..., "essay_id": ..., "student_id": ...}.

Observed error:

```
[ERROR] Input JSON must contain essay_text field.
```

4. Production readiness assessment

Area	Status	Reason
Batch input handling	Partially fixed	Gold loader can read essays[0], but Premium stage still receives the raw batch file.
Premium integration	Not ready	Premium runner stops before producing required session files.
Evaluator integration	Not tested in this run	Evaluator is downstream of Premium session loading, so it was not reached.
Gold Evidence Fusion / Feedback / LIE	Not tested in this run	These stages depend on Premium artifacts.
Operational usability	Blocked for batch inputs	Users can only proceed if they manually convert batch input to single-submission format.

5. Required fix

Before calling Premium, the Gold runner must write a normalized single-submission file into the Gold session folder and pass that normalized file to Premium.

Recommended internal file:

```
00a_normalized_submission_for_premium.json
```

The file should contain only:

```
{
  "essay_id": "essay_001",
  "student_id": "student_123",
  "prompt_text": "Do advantages of ageing population outweigh disadvantages?",
  "essay_text": "...full essay...",
  "task_type": "WT2",
  "topic": "Submitted Essay"
}
```

6. Recommended implementation change

In `GoldPipeline.run()`, after `load_submission()`, write `self.submission` to `00a_normalized_submission_for_premium.json`. Then call `run_premium_pipeline(submission_path=normalized_submission_path)` instead of `submission_path=self.input_path`. Keep the original uploaded file as `00_submission_raw.json` for audit, but do not send it directly to Premium when it uses the essays wrapper.

7. Temporary workaround

Until the runner is patched, create a separate `single_submission.json` containing the first essay object only, then pass that file to `--input`. This should allow the Premium runner to start normally.

8. Verdict

Do not freeze v1.1. The architecture is still correct, but the batch-to-Premium handoff has a blocking integration bug. This is a small, safe fix: normalize selected batch essay before Premium execution. After that, re-run and analyze the full Gold artifacts.
